

XML API 8.0.0 SP12 / 7.3.0 SP11 enhancements

XMLAPI 7.3.0 SP11
XMLAPI 8.0.0 SP12

Dear WebEx API Developer:

This notification applies to your integrations, if you are supporting sites on version WBS 28/WBS 29 and using XML API 7.3.0/XMLAPI 8.0.0.

A set of XML API enhancements will be applied to your production WebEx site [WEBEX_SITENAME] between **January 9, 2015 and January 24, 2015**.

All features will be **backward compatible** with your existing integrations. There are some schema changes to the XML API 8.0.0 schema. This communication is to serve as an informational update.

The XML API schemas and release notes will be available at the Cisco WebEx Developer Portal:

<https://developer.cisco.com/site/webex-developer/develop-test/xml-api/reference/>

If you have a development site as part of the Gold Developer Program, the API enhancements will be applied to them a few days in advance of being deployed to the production sites, between **January 6, 2015 and January 7, 2015**. Please perform regression testing after this deployment.

New XML API Features

Simplify Authentication Error Messages

Description:

For on-going security updates, the authentication error messages are being simplified. With this enhancement, username/password based authentication will return the error code/message "**Incorrect Username or Password**" (error code = 030002) for both Invalid password, or User Not found errors. Error code 030002 is an existing error code so there should be no impact to existing integrations with this change.

Affected XML APIs:

All APIs that use security context and will pass username/password for authentication

Please contact webex-meetings-api-dev@cisco.com if you encounter any issues or have questions about the deployment.
